

Protecting Disease Detectives

I predict this is going to be about...

Disease detectives need to stay safe when they are working with dangerous diseases. They wear special suits made from a strong, thick plastic. Their gloves are especially tough. The suit includes a long air hose. This hose connects them to another room, where there is clean air for them to breathe. There are also covered vents in the leg that let air out but won't let air in.

When the disease detectives leave the laboratory, they have to stand under a shower of disinfectant for about six minutes.

STOP

What connections can you make with keeping yourself safe?

Does anyone need to have anything clarified?

Does anyone have a question to ask?
